

# Soap Box Race

## Summary

**Age category**

6 - 8 years

**Topic**

Data & Statistics

Measurement

**Total duration**

205 minutes

Building a unique soap box car is fun, but it's also challenging. Students need to find out how they can build a soap box car that can reach the finish downhill as fast as possible. Each team creates an optimised prototype of a soap box car to organise their own race!

## Problems to be tackled:

What elements are needed for an optimal racing circuit?

How can we build the optimal starting slope for a soap box race?

What are the criteria for a good soap box car?

How do we build a soap box car based on the agreed criteria?

For example:

- How can we make a soap box car that goes as far as possible?
- How can we make a soap box car that reaches the finish line downhill?
- How can we make a soap box car that goes as fast as possible?
- How can we know which car wins the soap box race?

## Real context

### Real world motivation

Soap box races are a lot of fun. They are organised in many places throughout the world. People love them no matter how old they are. It's fun to look at all these soap box cars and it's even more fun to build your own unique soap box car. You can be really creative when you make your own special soap box car. Just check this out: <https://soapboxrace.redbull.com/uk/en/home/>

These races can also be quite challenging and a little dangerous too. As a consequence, students will first build a small soap box car for a mascot/puppet/etc. When they are sure about the important concepts of building a fast soap box car, they will have the keys to make a larger real one (optional). In this activity they will build a 'prototype' that they will optimise until they know exactly how to build a soap box car that can win a race!

If you want, you can also use the context of [a pinewood car](#).

## Goals

### Skills

- Students dare to tackle problems:

Co-funded by the  
Erasmus+ Programme  
of the European Union

- They work out a strategy in order to solve a problem
- They work out a procedure in order to solve a problem
- They carry out a plan
- They evaluate and reflect upon the product and research/design process
- Students agree on criteria to build a soap box car and use these criteria to evaluate their constructions, e.g. they can formulate that the wheels need to turn smoothly and that they need to build the wheels such that there is less friction.
- Students work efficiently and accurately by using a self-made simple plan, and by choosing simple materials and tools.
- Students investigate some concepts (friction, energy, action-reaction) by testing their hypotheses. They make 'if-then' relationships.
- Students formulate what needs to be optimised for a successful soap box car
- Students optimise their soap box car based upon an investigation.
- Students chose appropriate measurement tools to measure length and time.
- Students can measure length, distance.
- Students use appropriate terms according to the measurement (far, farther, etc.).
- Students can read and write measurement results in different ways.

## Knowledge

- Students use knowledge of materials and knowledge of concepts in relation to construction and movement (friction, action-reaction, energy) in order to construct the soap box car.
- Students use the right materials and tools while constructing the soap box car.
- Students use the right techniques in order to put things together.

## Methodology

Part	Description
1	<p><b>A soap box race is fun! Class talk</b></p> <ul style="list-style-type: none"> <li>• Students watch a movie about a soap box race, e.g. <a href="https://www.youtube.com/watch?v=7YsWYCSD8a0">https://www.youtube.com/watch?v=7YsWYCSD8a0</a></li> <li>• Students talk about what they have seen: What is typical for a soap box race, a soap box car, etc.?</li> <li>• Students are invited to <b>organise their own soap box race with unique cars that they build themselves!</b> be big cars like they have seen in the movie, but <b>small cars that can carry a puppet</b> (e.g. Playmobile, Lego, etc.) (e.g. doll, teddy bear, etc.).</li> </ul> <p><i>It is possible that students will be (more) motivated to build a real soap box car. You can stimulate them to first build for the puppet as they need to find out the optimal building conditions. You can clarify that they will be able to test the real car is much more difficult and dangerous (e.g. moving downhill).</i></p>

2	<p><b>Planning a soap box race/car - class discussion</b></p> <p>Students must identify the <b>criteria for a soap box race/car</b>:</p> <ul style="list-style-type: none"> <li>• Slope as starting point</li> <li>• Finish line</li> <li>• Track (straight, winding, etc.)</li> <li>• Decoration</li> <li>• Car: <ul style="list-style-type: none"> <li>◦ Self-made, handmade</li> <li>◦ Can carry one or more puppets</li> <li>◦ Looks fancy, funny</li> <li>◦ Moves downhill</li> <li>◦ Goes as far as possible ... (at least reach the finish line)</li> <li>◦ Goes fast*</li> <li>◦ ...</li> </ul> </li> <li>• ...</li> </ul> <p><i>* In a soap box race the criterion is 'as fast as possible', but actually, the first challenge is to reach the finish line. Students will have to optimise the car so that it can also go very fast.</i></p>
3	<p><b>Creating the soap box racing circuit - group work/class discussion</b></p> <p>Students work in groups (3-4 students). First, they need to design the racing circuit.</p> <ul style="list-style-type: none"> <li>• Each team makes a communal drawing of a racing circuit. The different elements of the circuit are then discussed length, finish line, slope, decoration, etc.</li> <li>• Students set up the racing circuit (at least a starting slope (see 4) and finish line).</li> </ul>

#### 4 Investigating the slope of the soap box racing circuit - group work

Students are given the challenge to design the optimal slope (= starting point of the circuit) with the materials they have (shelves, a number of blocks, etc.). At least, we want a car to reach the finish line!

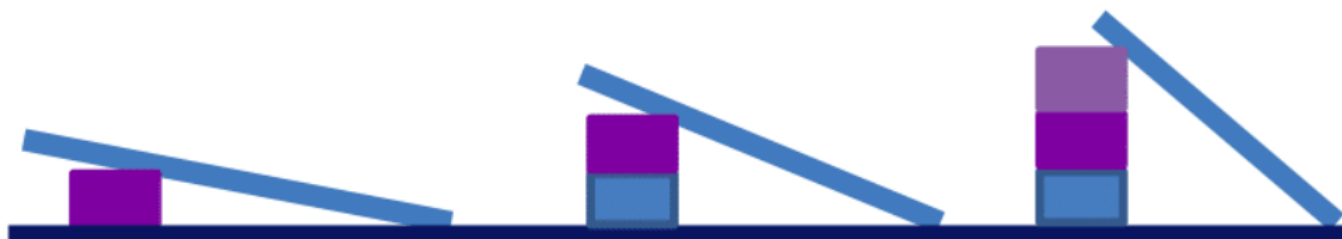

Students discuss what they need to investigate to create the optimal starting slope. They think of ways to investigate different slope conditions.

##### REMARKS:

- Fair and real testing is very important:
  - Controlling one variable at a time (e.g. change the length of the slope but not the height) to investigate the effect of the distance the car covers).
  - This also includes the idea of testing a condition (e.g. steep/low slope) multiple times. Let students discover the optimal conditions for themselves.
  - Students will have to come up with the idea that they all have to use the same playmobile/matchbox/etc. car to test the optimal conditions for the starting slope.
- They must think of ways of identifying how a car goes further when they test different slope conditions (e.g. marking/measuring/etc. the distances).

Students **investigate the height (gradient), length, etc. of the slope in relation to the distance the car covers**. How steep (high) does the slope need to be to make a car go as far as possible? E.g. does the length of the slope have an effect on the distance the car covers? (= different starting position of the car)

(on worksheet for children: we investigate 'slope' // we investigate 'starting position')

The optimal starting slope is set up at the beginning of the racing circuit.

## 5 Creating a soap box car - group work

Students are given the challenge of building a soap box car. Students work in groups (3-4 students). They obtain materials to fulfil the criteria they have put forward (see 2).

- Before they start building, they have to discuss and agree within their group about the design of their car. They make a drawing of their car. The drawings of the different groups can be discussed in class to learn from each other based on the criteria agreed on (see 2).
- Students start to build their own soap box car based on the criteria.

### REMARKS:

- Coach students by asking questions to help them think and solve problems on their own, e.g.
  - Which materials do you use?
  - What is going wrong? Why?
  - Are there other opportunities?
- This gives the opportunity to investigate scientific concepts, e.g. 'friction' (e.g. How do we need to attach the wheels that they can roll, which wheels should we use and how many, etc.?) and to use technical skills on account of different materials, tools, etc. (e.g. How can we attach two pieces of cardboard, etc.?)

6	<p><b>Testing and optimising a soap box car - class discussion/group work</b></p> <p>When most of the groups have a first prototype of their soap box car, the cars can be tested and discussed:</p> <ul style="list-style-type: none"> <li>• What do we see? What happens?</li> <li>• Why doesn't the car move (smoothly)?</li> <li>• What is the problem? What should we do better?</li> <li>• How can we make the car go farther/faster/etc.?</li> <li>• How can we measure the speed of the car? (= shortest time from start to finish)</li> </ul> <p>After testing, students can optimise their car.</p> <p>REMARK: Several attempts will be necessary, and an average of the different attempts can be made.</p> <p>Then, they can test again, optimise, etc. and finally, they should have created a car that meets the criteria as well as possible.</p> <p>REMARKS:</p> <ul style="list-style-type: none"> <li>• It's important to explicitly link to the criteria: First, they will have to find a way to get their car moving. The car should reach at least the finish line. Secondly, think for ways to make their car move faster. They should also think about: carrying the puppet, looking fancy/funny/etc.</li> <li>• Students will have to come up with ideas of how to identify if their car is moving farther/faster than during earlier attempts.</li> </ul>
7	<p><b>Soap box car race - the movie</b></p> <p>When every group is satisfied with their soap box car, the race can take place. Different prizes can be awarded based on the results, e.g. one award for the fastest car, one for the car that went the farthest, one for the most original soap box car, etc.</p> <ul style="list-style-type: none"> <li>• Students think about ways to decide who wins the race (e.g. measuring distances/time, allowing multiple attempts).</li> <li>• Every group makes a movie about the race. They present their car, the specifics of their car, the problems they had, etc. and finally, they film their car when it moves downhill towards the finish line. They collect all the information to make an attractive movie.</li> </ul>

## Organization

### Materials

		
		
		
		
		<i>Decoration material</i>

## Grouping

Groups consist of three or four students. These can be mixed groups of students with different talents who can help each other.

## Coaching

### Useful questions

**Context: Soap box car race is fun // Planning a soap box race/car**

- Can we make a soap box car that goes as far as possible?
- What do you think the criteria are for a good soap box car?

**Create the soap box racing circuit // investigate the slope**

- What elements do we need for the racing circuit?
- How can we be sure that we can build the most optimal racing circuit?
- How steep does the slope needs to be if we want to car to go as far as possible?
- Does the starting position affect the distance a car covers?

**Investigate and create - how to build a soap box car based upon the criteria?**

Co-funded by the  
Erasmus+ Programme  
of the European Union

- Can you devise a plan of how the soap box car should look?
- What materials will you need?
- What parts does your car need to have?
- How will you attach the different parts to each other? E.g. how will you attach the wheels to the car?
- What kind of wheels are you going to use? How many wheels?

### **Optimise and test**

- Why doesn't the car run smoothly?
- How can we optimise?
- What went well during the test?
- What went wrong during the test?
- How can you make it go faster?
- What needs to be optimised?
- How can we measure it?
- How can we test it?
- How can you be sure which car will go the farthest?
- How can you be sure which car will go the fastest?

### **Assessment**

#### **Teacher's assessment:**

Assessment will take place in a formative way, especially regarding:

- Problem solving (*e.g. in order to find the right solution for building the most optimal racing circuit*)
- Planning (*e.g. how to build a soap box car based upon agreed criteria*)
- Reflecting (*e.g. reflecting on the process: how did we attempt to make a car that goes as far as possible/as fast as possible?*)
- Collecting, analysing and interpreting data (*e.g. during testing*)

#### **Student's assessment:**

- Cooperate and add value to group work
- Schedule tasks, time and resources
- Individual contribution to the work
- Reflect on process and results of the different stages of this activity
- Analysing and Interpreting data in order to optimise
- Designing and producing a real 'model' from a design they have made on paper
- Making and using a plan

### **Tips & tricks**

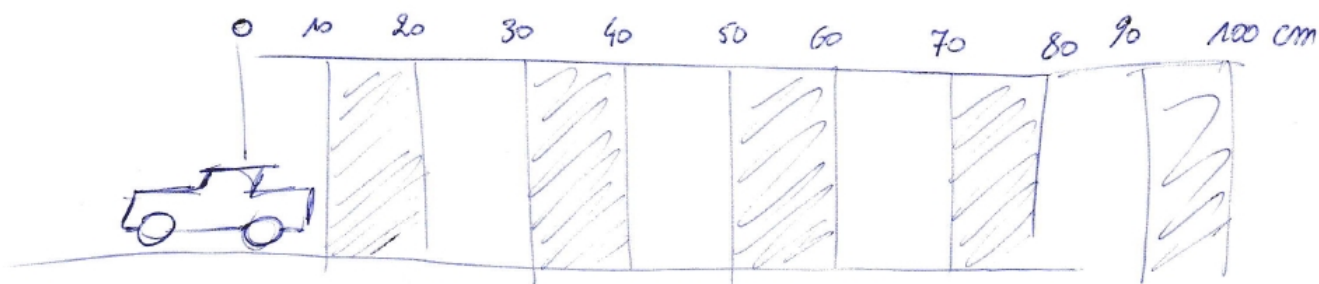

Idea for measuring distance with the students:
